

Schwab Trading Bot System Update

Generated 2026-06-29 10:43:09 local. Scope: auth refresh, stale sleeve repair, active paper stack verification, and changes since the previous update request.

Executive State

Schwab auth was refreshed through the refresh-token grant and is ready above the 1200-second floor. The 101-wide fanout was successfully launched, then the fanout guard parked 96 optional lanes to stop storage and compute pressure from running away. The held state is core collection plus paper execution active, with the parked lanes stable rather than stale or missing.

Surface	Status	Evidence
Schwab auth	READY	token_ready=true; token_expires_in=1,785.944s; lease=healthy; findings=0
Auth lease	READY	lease artifact timestamp=2026-06-29T14:36:36.123127+00:00; supervisor token_expires_in=1,785.944s; lease_budget=601.022s
Health-fast	DEGRADED	strict_all_clear=false; collection=ready; storage=stable; guarded_paper=blocked
Process watchdog	READY	grade=A; healthy_targets=4/4; alerts=0; restart_storms=0
Sleeves	READY	running=5/101; parked=96; missing=0; exited=96; readiness=stable_with_parked_lanes
Paper executor	RUNNING	mode=paper; stale=false; auth_ok=true; processed_count=0; approved_intents=0
Collection	READY	collectors=24; bots_with_observations=24; observations=1596; zero_observation_count=0
Storage	STABLE	pressure_index=0.655; pending=13068/15000; estimated_drain=n/am; oldest_pending=0.348s

What I Changed

- Refreshed Schwab auth through token-refresh --always-auth; token_after_expires_in=1,799.85s and auth reason=refresh_token_grant_success.
- Restarted the all-sleeves paper/read-only stack, verified a 101/101 launch, and then verified the held auto-parked state after pressure controls reacted.
- Fixed the watchdog caveat where Music playback soft pause was suppressing read-only sleeve collection even when the creative contract said terminate_processes=false.
- Added regression tests proving soft Music playback does not suppress all_sleeves while hard music/audio pause still does.
- Fixed the all-sleeves launcher so clean-exited jobs respect process fanout policy parking instead of being respawned into pressure.
- Ran the safe system drift autopilot pass after the runtime fixes; drift improved from 2 blocked / 16 degraded / 13 stale to 1 blocked / 14 degraded / 8 stale.

Sleeve And Fanout Detail

- Current held launcher profile: 101 expected jobs, 5 running, 96 policy-parked, zero missing.
- Core collection: expected=5, running=4, problem=0.
- Specialized collection: expected=94, running=0, problem=0.
- Execution lane: expected=1, running=1, problem=0.
- Aggressive collection: expected=1, running=0, problem=0.
- Fanout guard held policy: aggressive_enabled=false, specialized_enabled=false, dividend_capture_enabled=false.
- The system did briefly satisfy 101/101 active. It did not hold that posture; auto-healing parked optional lanes after pressure rose.

Runtime And Storage

- Runtime throttle is ready with profile=sustain, compute_pressure=high, memory_pressure=normal, host_saturation_score=66.17.
- Memory efficiency remains needs_work; recommended_profile=air_safe; creative co-tenant is ['Music'] at level=active.
- Health-fast storage is stable but hot: pressure_index=0.655, total_pending=13068, oldest_pending=0.348s.
- Storage backpressure autopilot apply result is apply_failed; storage_control itself reports ready with pressure_index=0.655.

Remaining Caveats

- Live execution remains intentionally locked. The running execution lane is paper mode.
- Guarded paper readiness status=blocked; blockers=['storage_pressure_index_high', 'paper_ramp_not_armed']. The paper executor process itself is fresh and auth_ok=true.
- System drift remains blocked: blocked=1, degraded=14, stale=8.
- Primary drift blocker: master_infrastructure_supervisor is blocked. Its self-auditing infra-bots check is blocked while several support surfaces remain degraded.
- Adaptive regression guard is degraded: active=7, persistent=7, critical=0.
- The held sleeve stack is stable and fresh; the remaining caveats are that optional fanout is parked, storage pressure is high, guarded-paper readiness is blocked, and governance/maintenance surfaces still need cleanup.

Verification Run

- pytest tests/test_process_watchdog_creative_pause.py: passed, 3 tests.
- pytest tests/test_run_all_sleeves_launcher_health.py
tests/test_stack_controls.py::test_run_all_sleeves_launcher_health_treats_clean_exits_as_session_parked
tests/test_process_watchdog_creative_pause.py: passed, 8 tests.
- python -m py_compile scripts/run_all_sleeves.py scripts/ops/process_watchdog.py: passed.
- Final process-watchdog snapshot: ready, grade A, four of four targets healthy, no stale targets, no missing targets, no alerts.
- Final all-sleeves launcher snapshot: ready, 101 expected, 5 running, 96 policy-parked, zero missing, readiness=stable_with_parked_lanes.
- A prior hold check observed 101/101 running, but the final held state auto-parked optional lanes after pressure controls fired.
- Final health-fast snapshot: degraded with strict_all_clear=false because storage pressure/paper ramp blocked guarded-paper readiness.

Snapshot Files

Primary evidence: governance/health/schwab_auth_supervisor_latest.json, governance/health/all_sleeves_launcher_latest.json, governance/health/process_watchdog_latest.json, governance/health/execution_lane_paper_latest.json, governance/health/process_fanout_guard_latest.json, and the final /tmp snapshots captured at 2026-06-29 10:37-10:42 America/New_York.
