Soak Pause And Pre-Downtime Runtime Evidence Packet

Apple battery service interruption with one-week pre-service runtime evidence

Pre-downtime runtime window	2026-07-07 14:40:00 EDT / 2026-07-07 18:40:00Z to 2026-07-14 14:40:00 EDT / 2026-07-14 18:40:00Z
Documented downtime window	2026-07-14 14:40:00 EDT / 2026-07-14 18:40:00Z to 2026-07-22 20:53:55 EDT / 2026-07-23 00:53:55Z
Recorded downtime duration	8 days, 6 hours, 13 minutes, 55 seconds
Treatment	Planned external hardware maintenance between soak segments; not a trading-system failure or degradation.
Mode posture	Paper trading and data collection evidence; live order submission remained disabled.

Executive Summary

This packet documents the Apple battery service downtime and the exact one-week runtime evidence window immediately before that downtime. The pre-service evidence shows Schwab authentication activity, runtime ingestion, watchdog SLO checks, risk-budget control samples, critical protective lane-kill events, and local livefeed refresh snapshots inside the audit window. Segment 2 was accepted only after post-service readiness, route, paper, runtime, and soak-readiness checks passed.

Finding	Evidence
Downtime was planned and external	Maintenance event status is completed; offline window is recorded from 2026-07-14 14:40:00 EDT to 2026-07-22 20:53:55 EDT.
Pre-service posture was ready	Unattended soak readiness was ready/A+; live readiness smoke was ready with score 100.0; submit_enabled was 0.
Runtime was active before service	Auth stream has 13,226 success events; runtime ingestion journal has 5,462 rows and 120,148 inserted runtime records with 0 invalid rows in the evidence window.
Watchdogs did not classify an outage	14 watchdog SLO samples were overall_ok=true with 0 alert rows in the preserved SLO stream.
Risk controls were active	587 critical records appear in the alert stream, mostly lane_kill_switch_engaged due to spread_bps. These are protective trading controls, not the maintenance downtime marker.

Maintenance Window

Event ID	20260714_apple_battery_service_soak_pause
Classification	planned_external_hardware_maintenance
Status	completed
Offline start	2026-07-14T14:40:00-04:00 / 2026-07-14T18:40:00Z
Offline end	2026-07-22T20:53:55-04:00 / 2026-07-23T00:53:55Z
Soak accounting	planned_maintenance_interruption_between_soak_segments
Review statement	The 30-day soak should preserve the pre-service segment as valid evidence, document the hardware-service pause, and restart continuity counting only after post-service health checks pass.

One-Week Runtime Evidence

Window: 2026-07-07 14:40:00 EDT through 2026-07-14 14:40:00 EDT. Counts below use only local artifacts whose timestamps fall inside that exact interval.

Date (UTC)	Auth Success	Auth Errors	Runtime Inserted	Critical Risk Events	Watchdog OK/Samples	Livefeed Logs
2026-07-07	321	0	0	0	0/0	0
2026-07-08	1,758	0	0	0	0/0	1
2026-07-09	1,440	0	25,568	15	0/0	2
2026-07-10	3,206	0	54,682	123	7/7	2
2026-07-11	1,422	0	1,544	36	4/4	3
2026-07-12	1,617	0	1,054	99	2/2	0
2026-07-13	2,180	10	25,300	314	1/1	5
2026-07-14	1,282	0	12,000	0	0/0	1

Aggregate Runtime Signals

Auth evidence	13,226 auth_success records; 10 explicit auth_error records; first 2026-07-07T18:48:51.268894+00:00; last 2026-07-14T17:51:24.643961+00:00.
Runtime ingestion	5,462 journal rows; 120,148 inserted records; 0 invalid rows; 392 source paths; 121 ingest runs.
Watchdog SLO	14 samples; 14 overall_ok=true; 0 alerts in preserved SLO samples.
Risk budget	Execution budget samples: 14; risk_level low in 14; max slo_alert_count 0.
Livefeed refresh	14 refresh logs; first 2026-07-08T10:37:41+00:00; last 2026-07-14T18:39:56+00:00 - 44 seconds before the planned downtime start.

Protective Critical Events

Metric	Value
Total critical records	587
Lane kill switch records	580
Broker truth reconcile records	7
Top reason family	spread_bps in 580 records
Top symbols	OP-USD (198), CL (47), PEPE-USD (32), VIG (29), DOT-USD (25), JNK (24), MDY (22), RSP (11)

Interpretation: these records show active risk controls engaging during runtime. They should remain visible as operational evidence, but they are not the Apple-service downtime marker and should not be used to classify the planned hardware pause as a system failure.

Pre-Service And Post-Service Checkpoints

Checkpoint	Recorded Result
Pre-service unattended soak readiness	status=ready; grade=A+; target_days=30.0
Pre-service live readiness smoke	overall_status=ready; readiness_score=100.0; submit_enabled=0
Backup verification	primary=218G / 57,344 files; secondary=9.7G / 17,192 files; git bundle=ok_complete_history
Segment 2 acceptance	accepted=2026-07-22T20:53:55-04:00 / 2026-07-23T00:53:55Z; segment=2; status=active
Post-service soak readiness	overall_status=ready; grade=A+; score=100.0; safe_unattended=True
Post-service paper guard	overall_status=ready; paper_stage=armed; failed_guards=0
Post-service paper truth	overall_status=ready; grade=A+; score=97.0
Post-service process watchdog	overall_status=ready; all_sleeves_running=True; jobs=22/22; child_processes=25

Evidence Limitations

- The report uses local repository artifacts only. It does not contact Schwab, Coinbase, Apple, or any external service.
- Some raw runtime channel files from July 7-14 appear to have been compacted or offloaded; the preserved runtime ingestion journal records the source paths, ingest runs, inserted counts, invalid counts, and timestamps.
- Auth start and auth success counts are not paired in this report because boundary effects can put a start or completion just outside the exact one-week window. Explicit auth_success and auth_error records are reported as observed.
- Critical lane kill switch events are reported because they are operationally important; they are not treated as downtime in this maintenance accounting packet.
